

Zika virus (Zika) is one of several infections transmitted by the Aedes mosquito, which also

transmits Dengue and Chikungunya. It is also possible to spread Zika through blood transfusions and sexual contact. The best way to prevent Zika is to prevent mosquito bites. No vaccine or specific treatments are available to prevent or treat Zika.

The American Red Cross is asking people to avoid donating blood if they traveled to Latin America or the Caribbean in the past 28 days. Until more is known, if your sexual partner

has traveled to or lives in an area with active Zika virus transmission, you should abstain from sexual contact or correctly use condoms everytime you have vaginal, anal, and oral sex for the duration of the pregnancy.

BLOOD TRANSFUSIONS

SEXUAL CONTACT

Where is it found?

Zika is common in areas of Africa and Asia. Most recently, it has been rapidly spreading in South and Central America. The virus is expected to spread to nearly all countries in the Americas.

What can you do to protect yourself?

The best way to prevent Zika is to prevent mosquito bites. No vaccine or specific treatments are available to prevent or treat Zika.

CIVILIANS AND OFF DUTY SOLDIERS:

- Minimize time outside when mosquitos are active.
- Empty water from containers such as garbage cans, wading pools and flower pots.
- Control mosquitoes around the home by eliminating standing water where mosquitoes breed.
- Wear long-sleeved shirts and long pants.
- Stay in places with air conditioning or use screens that keep mosquitoes outside.
- Use DEET or picaridin insect repellent on exposed skin.
- Treat clothing and gear with permethrin or buy permethrin-treated items.

CONTAINERS

Wear a factory-treated Army Combat Uniform (ACU Permethrin). Check the tag in your uniform to confirm it is factory-treated. The Army Physical Fitness Uniform (APFU) is not treated with permethrin.

What are the symptoms? About 1 in 5 people infected with Zika becomes ill. The illness is

usually mild and symptoms last from several days to a week. Recently, Zika infection has been linked to Guillain-Barré syndrome and to infants born with birth defects. CONJUNCTIVITIS (RED EYES)

What are the dangers for pregnant During pregnancy Zika may pass from mother to baby. Some women

infected with Zika while pregnant have had babies born with microcephaly, a condition where a baby is born with an abnormally small head and incomplete brain development. Normal head size Studies are underway to learn more about the

spread of Zika from mother to baby and the risks of Zika infection during pregnancy.

Pregnant, nursing, or trying to get pregnant? Women who are pregnant (in any trimester) should consider

postponing travel to any area where Zika virus transmission is ongoing. If you must travel to one of these areas, talk to your doctor first and strictly follow steps to prevent mosquito bites during your trip. Use of approved insect repellents is safe during pregnancy.

• Speak with your healthcare provider to discuss the risk of infection with Zika.

• The ACU with permethrin is safe to wear; however, if you are pregnant, nursing, or trying to get pregnant you are authorized to temporarily wear an ACU without permethrin.

If your uniform is not treated with permethrin (maternity or untreated ACU) and you and your healthcare provider decide that wearing an ACU with permethrin is the best choice, you can learn how to treat your ACU by visiting: IDA kit NSN 6840-01-345-0237
